Expert Report of Julie Chambers November 18, 2024

Expert Report Related to Illinois River and Tenkiller Ferry Lake, Oklahoma

Prepared by: Julie Chambers, Oklahoma Water Resources Board

November 18th, 2024

Assignment:

I was asked to review findings by the Court regarding Lake Tenkiller, made on the evidentiary record developed in the 2009-10 trial, and to render an expert opinion as to whether they still hold true today. Specifically, I was asked to review the following findings:

- 1. Lake Tenkiller has become eutrophic, and this eutrophication is caused by phosphorus concentrations in the reservoir.
- 2. Lake Tenkiller's phosphorus-induced eutrophic condition is manifested in a variety of ways: an increase in amounts of algae, a decrease in water clarity, and a decrease in dissolved oxygen.
- 3. The decreases in water clarity in Lake Tenkiller are having an adverse impact on recreational activities and aesthetics.
- 4. Phosphorus concentrations in excess of natural or background levels have caused degradation of water quality in Lake Tenkiller and have impaired its aesthetics, fish and wildlife, and public water supply beneficial uses in violation of Oklahoma's antidegradation standards in Okla. Admin. Code (OAC) § 252:730-3-2(b) and (d).
- 5. Total phosphorus concentrations have caused impairment of the aesthetic beneficial use for 8,440 acres of Lake Tenkiller that is designated in OAC 252:730 (App. A.1.) of the Oklahoma Water Quality Standards.
- 6. As a result of phosphorus concentrations, a 5,030-acre section of Lake Tenkiller is not meeting its public water supply beneficial use and is violating water quality standards due to chlorophyll-a levels in excess of the numerical criterion in OAC 252:730-5-10(7) of the Oklahoma Water Quality Standards.
- 7. Phosphorus has caused injury to Lake Tenkiller, as well as the biota therein.

I was also asked to answer the following questions related to the 2023 Arkansas-Oklahoma Arkansas River Compact Report:

- 8. What does the 2023 Water Quality Monitoring Report for the Illinois River Basin (Arkansas-Oklahoma Compact) tell us about whether the water in the Oklahoma portion of the Illinois River Watershed is meeting the .037 mg/L water quality standard for phosphorus?
- 9. What does the 2023 Water Quality Monitoring Report for the Illinois River Basin (Arkansas-Oklahoma Compact) tell us about trends in the phosphorus loading in the Oklahoma portion of the Illinois River Watershed over the past five years?
- 10. When targeted high-flow water sampling data is included in Oklahoma's Illinois River Watershed water sampling data, what does the data show with respect to phosphorus loading and concentrations in the Oklahoma portion of the Illinois River Watershed?

Frankling.

Experience:

I've been with the Oklahoma Water Resources Board (OWRB) since 1999 and currently serve as the Environmental Programs Manager, leading the Beneficial Use Monitoring Program (BUMP) Lake Monitoring section. I have 25 years of experience in statewide water quality management, from program design through data collection, management, reporting, and dissemination of information. I am responsible for making recommendations for the State's Integrated Report. Over the last 22 years I've successfully led efforts conducting water quality studies, including the National Lake Assessment, and bathymetric surveys on reservoirs across Oklahoma, as well as managing lake and wetland projects funded through federal grants and other contracts.

I am actively engaged in professional organizations, serving on the Board of the Oklahoma Clean Lakes and Watersheds Association and on the Water Quality Steering Committee for the EPA's National Lake Assessment. I also participate in several state technical workgroups focused on the assessment of lakes and field protocol development. As the Oklahoma Environmental Chair for the Oklahoma-Arkansas River Compact Commission, I am responsible for the completion of the annual Water Quality Monitoring Report, specifically addressing phosphorus loading.

For 20 years, I have been an active member of The North American Lake Management Society (NALMS), serving on various committees and in leadership roles, most recently have been re-elected as president after first holding the position in 2016.

I hold a Bachelor of Science in Biology from the University of Central Oklahoma, with a minor in History.

A copy of my resume is attached to this Report.

No compensation has been provided for my testimony, and I have not testified at trial or by deposition in the past 4-years.

Methodology:

For the development of my opinions, I have relied upon my experience with performing assessments for the Integrated Report using assessment protocols outlined in OAC 252:740-15 and the Continuing Planning Process (CPP), completion of the annual Arkansas-Oklahoma Compact Report, and relevant literature.

Assessments for the Integrated Report -

Assessments for the Integrated Report (303(d) list) are completed on a bi-annual cycle and submitted to EPA in even numbered years.

The Oklahoma Department of Environmental Quality (ODEQ) is responsible for submitting the report to EPA and starts the process each cycle by soliciting data and information from various entities, including other state agencies, cities, and tribal nations.

For the lake assessments, including Lake Tenkiller, data are compiled and analyzed to determine attainment of beneficial uses. Data and analytical results are compared to water quality standards and assessment protocols outlined in the Use Support Assessment Protocol (USAP) in OAC 252:740-15 and the Continuing Planning Process (CPP) document. Following this analysis, recommendations for listing or delisting water bodies are submitted to the ODEQ, which is the agency responsible for completing the State's Integrated Report. Ultimately, the state's Integrated Report is submitted to the U.S. EPA for review and approval. The U.S. EPA has approved the State's 2022 Integrated Report.

The State is awaiting approval of its 2024 Integrated Report, which was submitted to the U.S. EPA

Arkansas-Oklahoma Arkansas River Compact Report -

about a month ago.

The Oklahoma-Arkansas Arkansas River Compact Commission's Environmental Committee annually creates a report that shows both an annual total phosphorus (TP) loading as well as a 5-year rolling average of TP at four sites—Illinois at Tahlequah, Illinois at Watts (state line), Barren Fork at Eldon, and Flint Creek at Kansas. The 5-year rolling average is compared to a Baseline TP loading (1980-1993) and a 40% reduction goal for each of the sites. The 40% reduction goal comes from the 1996 Diagnostic and Feasibility Study on Tenkiller Lake, which indicated that to reduce/reverse eutrophication in the lake, up to a 40% reduction of influent of total phosphorus from 1992-1993 levels was needed.

To calculate the TP load, 3 types of information are required: Stream flow data, TP concentration, and time. A loading conversion factor (CF) is also applied to all calculations. For the Compact, both Oklahoma and Arkansas use the same calculation to ensure loading for each state's respective stations are calculated identically. The equation is:

2.446848(CF) X Flow (cfs) X TP (mg/L) X 365 (days) = Annual Load

The loadings for the Water Quality Monitoring Report only use data collected by the OWRB and the U.S. Geological Survey (USGS) on ambient monitoring visits—those made on a routine monthly basis—and do not use targeted storm flow data. Because targeted storm flow samples were not available during the Baseline Period (1980-1993), the baseline and 40% reduction target were set using only ambient data. This was agreed to by both states and approved by the Compact Commission. Additionally, the USGS did not start targeted storm-flow sampling until 1999.

Opinion:

The following are my opinions and the reasons for them. The opinions provided in this Report, based on my education, training, knowledge, and experience in the field of water quality management, are held to a reasonable degree of scientific certainty.

Lake Tenkiller is currently considered eutrophic based on trophic state classification. Lakes that
have high nutrient concentrations and productive plant growth are described as eutrophic.
Carlson (1977) developed the most commonly used chlorophyll biomass based trophic status
index (TSI) to classify and describe lakes. The Carlson chlorophyll TSI metric has long been used
by OWRB to determine lake trophic status and the equation is included below.

Carlson's TSI calculation based on chlorophyll-a biomass

TSI = 9.81xln(chlorophyll-a) + 30.6

Lake Trophic State Categories

Trophic State	Carlson TSI Value	Trophic Description
Oligotrophic	≤ 40	Low primary productivity and/or low nutrient levels
Mesotrophic	41-50	Moderate primary productivity with moderate nutrient levels
Eutrophic	51-60	High primary productivity and nutrient rich
Hypereutrophic	<u>></u> 60	Excessive primary productivity and excessive nutrients

The current TSI for the lower portion of Lake Tenkiller (WBID121700020020) is 50 and is 59 for the upper portion (WBID 121700020220). The basis for this listing relied upon the 10 years of data collected by the OWRB and analyzed in the assessment for the 2022 Integrated Report.

- 2. Lake Tenkiller continues to be listed as not supporting beneficial uses for dissolved oxygen, total phosphorus, and chlorophyll-a on the state's 2022 Integrated Report. ¹
- 3. Decreases in water clarity in Lake Tenkiller continue to adversely impact recreational activities and aesthetics i.e., scuba diving is a recreational opportunity at the lake and reduced or lower water clarity impacts this activity by reducing visibility. That nutrient loading into the lake has increased algal growth and reduced water clarity is a finding that was included in the 1999 Diagnostic and Feasibility Study on Tenkiller Lake, and is a finding that remains true today based upon OWRB's analysis of water quality data
- 4. The lake continues to be listed as impaired for the aesthetics (AES), fish and wildlife (FWP), and public water supply (PPWS) on the 2022 Integrated Report. This is in violation of Oklahoma's antidegradation standards in Okla. Admin. Code (OAC) § 252:730-3-2(b) and (d). The basis for this listing relied upon the 10 years of data collected and analyzed by the OWRB, and that analysis was used for assessment for the 2022 Integrated Report.
- 5. Lake Tenkiller is currently designated as an NLW (nutrient limited watershed), meaning a watershed of a waterbody with a designated beneficial use which is adversely affected by excess nutrients as determined by Carlson's Trophic State Index (using chlorophyll-a) of 62 or greater in OAC 252:730 (App. A.1.) of the Oklahoma Water Quality Standards. Lake Tenkiller also currently has the designation of HQW (high quality water) which carries additional protections outlined in OAC 252:730-5-25.
- 6. Lake Tenkiller (WBID 121700020220) is not currently meeting its public water supply beneficial use and is violating water quality standards due to chlorophyll-a levels greater than the numerical criterion of 0.010mg/L as outlined in OAC 252:730-5-10(7) of the Oklahoma Water Quality Standards. The basis for this listing relied upon the 10 years of data collected by the OWRB and analyzed that was used for assessment for the 2022 Integrated Report.
- Lake Tenkiller's water quality has not improved since the 2009-2010 trial as the lake continues to be listed as impaired. This determination is based upon extensive data collected, analyzed by the OWRB, and utilized for the Integrated Report.

¹ This is the most current list as the 2024 Integrated Report was submitted earlier this year to the EPA, and we are awaiting EPA approval.

Compact Related Opinions:

- 8. The 6-month rolling arithmetic means at all stations exceed the 0.037 mg/L total phosphorus criterion for the most recent 5-year time frame 2019-2023, as well as the period of record assessment time frame of 1999-2023.2 The source of data for these assessments is water quality data collected by both the OWRB and USGS, with flow data provided by the USGS.
- 9. Based upon OWRB and USGS provided water quality data, trends in phosphorus loadings show that there is an upward tick in the most recent 5-year rolling average time window (2019-2023), and that loadings are generally not meeting the 40% reduction goal, as seen at the Illinois at Tahlequah and Flint Creek, in the 2023 Water Quality Monitoring Report for the Arkansas-Oklahoma Arkansas River Compact. See graphs included in Appendix.
- 10. When targeted high-flow water sampling data from the USGS is included with the ambient sampling data collected in the Oklahoma portion of the Illinois River Watershed, the data show an increase in both average annual phosphorus concentrations and loadings at all stations in the Oklahoma portion of the Illinois River Watershed. Ambient data is provided by the OWRB and USGS. Targeted high-flow data are provided by the USGS, and these data are regularly above the 0.037mg/L. See graphs and tables included in Appendix.

JULIE CHAMBERS

PROFILE

Highly motivated self-starter with over 20 years of experience in water quality management, data collection and data utilization.

Participated on and led multiple projects, whose success has been attributed to excellent project management, communications, and planning skills.

Dedicated leader and experienced supervisor

PROFESSIONAL EXPERIENCE

ENVIRONMENTAL PROGRAMS MANAGER

OKLAHOMA WATER REOURCES BOARD I 1999-PRESENT

- Manage the Lake and Wetlands Monitoring section of the Water Quality Programs Division
 - o 35-40 lakes sampled statewide on an annual basis
 - Wetland projects: identifying potential reference systems - statewide scale; current project is investigating biogeochemistry of oxbow & riverine wetland systems in a localized area.
- Manage program development and operational logistics for lentic systems, including network design, data management, analysis and report writing.
- Conducts program/project budgeting for BUMP and grants, million-dollar budget
- Ensures lake/wetland data collection activities related to federal grants, intra-agency and contracts occur in an efficient and timely manner.
- Collaborate with technical staff to implement project ideas and plans.
- Develop/maintain SOP's related to lake and wetland data collection activities
- Manage a staff of 7 as well as seasonal employees; directing and reviewing work to ensure success.
- Oversee and participate in all aspects of field work
- Make presentations to the Board, represent agency at Water Day at the Capital and other events.

7177 Orchard Trail Edmond, OK 73025

EDUCATION

B.S, BIOLOGY MAJOR / HISTORY MINOR University of Central Oklahoma 1995

KEY SKILLS

Project Planning & Management
Customer Relations
Budgeting
Skillful Communications
Detail Oriented
Organizational Effectiveness
Writing / Editing
Leadership / Guidance
Water Quality Program Development & Implementation
Strong Interpersonal Skills
Team Player
Dependable
Willingness to take on responsibilities

PROFESSIONAL EXPERIENCE

LEADERSHIP

- President-elect of the North American Lake Management Society
- Past President of the North American Lake Management Society
- Represent the agency as co-chair for the Environmental Committee of the Arkansas-Oklahoma Compact
- Represent the agency on the board of the Oklahoma Clean Lakes and Watersheds Association
- Represent the agency on the Water Quality steering committee for the EPA's National Lake Assessment
- Trainer for USEPA Region 6, for 2012 National Lakes Assessment
- Participate on Oklahoma Water Reuse Workgroup- Water Quality Standards Subcommittee
- Participate on Grand Lake Technical Workgroup
- Serve on various statewide and interstate committees related to nutrient criteria, water quality standards development, TMDLs and implementation
- Serve on the OWRB's SCC Committee, Picnic Committee and Employee Recognition Committee
- Serve as the OWRB's agency safety officer
